

An Incremental Algorithm

⌘ Input: endpoints (x_1, y_1) and (x_2, y_2)

⌘ Compute $a = \frac{(y_2 - y_1)}{(x_2 - x_1)}$

⌘ Line equation $y = ax + (y_1 - ax_1) = ax + b$

⌘ for $x := x_1$ to x_2

 ⊠ $y := \text{Round}(ax + b)$

 ⊠ $\text{DrawPixel}(x, y)$

Rasterization

⌘ Clip primitives to viewing window.

⌘ Transform clipped primitives to device coordinates.

⌘ Points: round floating point coordinates to nearest pixel coordinates.

⌘ Lines: determine the coordinates of all pixels that "lie" on the line.

The Midpoint Algorithm

⌘ Assumption: line has slope 'a' between 0 and 1

⌘ Idea: choose the next pixel by checking if the midpoint is above or below the line.

Incremental Algorithm

⌘ Note: when x is incremented by 1, y is incremented by a

⌘ $\text{DrawPixel}(x_1, y_1)$

⌘ $y := y_1$

⌘ for $x := x_1 + 1$ to x_2

 ⊠ $y := y + a$

 ⊠ $\text{DrawPixel}(x, \text{Round}(y))$

The Midpoint Algorithm

⌘ Given a chosen pixel (x, y) , the next pixel will be:

 ⊠ $(x+1, y)$ if $F(M) \leq 0$ (denote this pixel by E)

 ⊠ $(x+1, y+1)$ if $F(M) > 0$ (denote this pixel by NE)

The Midpoint Algorithm

⌘ Each line can be written using the line equation:

$$F(x, y) = Ax + By + C = 0$$

⌘ The relation between any point (x, y) and the line can be determined by the sign of $F(x, y)$:

 ⊠ $F(x, y) = 0$ for points ON the line

 ⊠ $F(x, y) < 0$ for points ABOVE the line

 ⊠ $F(x, y) > 0$ for points BELOW the line

The Midpoint Algorithm

- ⌘ If $d \leq 0$, we choose $(x+1, y)$ (E)
 - ⊠ $M = M + (1,0) \Rightarrow d = d + A$
- ⌘ If $d > 0$, we choose $(x+1, y+1)$ (NE)
 - ⊠ $M = M + (1,1) \Rightarrow d = d + (A + B)$
- ⌘ Each iteration we compute d by adding either A or $(A+B)$, based on the sign of d

The Midpoint Algorithm

- ⌘ For each pixel compute: $d = A(x+1) + B(y + \frac{1}{2}) + C$
- ⌘ Make a decision based on sign of d
- ⌘ Incrementally update M and d

The Midpoint Algorithm

Referring to the implicit line equation:
 $y = (dy/dx)x + b \Rightarrow F(x,y) = Ax + By + C = (dy)x - (dx)y + C = 0$,
 the Midpoint algorithm is as follows:

```

dE = 2*A           /* In order to avoid fractions we'll
dNE = 2*(A+B)      /* multiply the equations by 2
x = x0, y = y0
d = 2*A+B
DrawPixel( x0, y0 )
while ( x < x1 ) {
    if ( d <= 0 ) { d = d + dE, x++ }
    else { d = d + dNE, x++, y++ }
    DrawPixel( x, y )
}
    
```

The Midpoint Algorithm

- ⌘ What should the initial value of d be?

$$\begin{aligned}
 F(x_1 + 1, y_1 + \frac{1}{2}) &= A(x_1 + 1) + B(y_1 + \frac{1}{2}) + C \\
 &= Ax_1 + By_1 + C + (A + \frac{B}{2}) \\
 &= F(x_1, y_1) + (A + \frac{B}{2}) \\
 &= (A + \frac{B}{2})
 \end{aligned}$$

- ⌘ To avoid division, we'll multiply everything by 2, and result with the following algorithm:
